

Wiki — What members and admins see

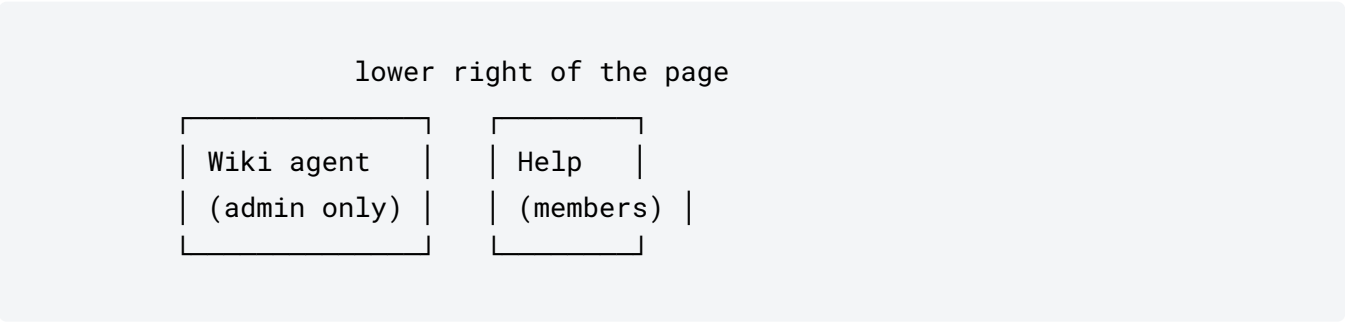

Where: `https://labs.fattail.ai/app/wiki`

As-built: 2026-08-24 · Wiki Spec v0.2.1 · **DL-573** (agent on the whole Labs plane)

This is the experience list — what a person actually sees and can do. It is not the engineering packet list.

Nothing here is a profit claim. The wiki is the compiled map of what we teach. Pages publish only when a human approves them.

Lower-right chrome (every Labs page)

Control	Who sees it	Look
Wiki agent	Administrators only	Zinc pill, sentence-case “Wiki agent”, immediately left of Help
Help	Signed-in members (not /admin)	Emerald pill, rightmost

Members never see the Wiki agent — not on Wiki, not on Options Lab, not anywhere. Unauthenticated visitors see neither pill until they sign in (then Help only, unless they are an administrator).

On `/admin/*`, Help is hidden. The Wiki agent stays, still lower-right.

Members and the public

Find the Wiki

1. Open **Apps**.
2. Open **IKI Lab**.
3. You are on **Wiki** (/app/wiki), with the suite pills **Wiki** · **IKI Factory** · **Runner**.

Search is first. The home has a search field, **Start here** (pinned pages), and recent pages.

Read

Surface	What you get
Article	/app/wiki/{slug} — title, body, wikilinks into other pages
Search	/app/wiki/search?q= — page hits with snippets
Graph	/app/wiki/graph — map of pages and links (list fallback if the graph is large)
⌘K / Ctrl+K	Quick switcher on Wiki routes — jump to a page by title

Published pages are readable without signing in. Drafts are not: unauthenticated and non-admin requests 404. Search engines get published slugs only.

The article rail does **not** yet fill **Related** or **In your practice**. Empty sections stay hidden. That is as-built, not a broken page.

Help (unchanged)

The emerald **Help** pill is the member concierge — ask a question, attach a screenshot on a bug, talk to a human if the assistant cannot help. It is not the Wiki agent and it does not write wiki pages.

Administrators

The Wiki agent is standing presence: it rides with you on the **entire FatTail app plane** (Apps, Wiki, Options Lab, Trade Log, courses, `/admin`, and the rest of AppChrome), not only inside IKI Lab.

Open the agent

1. Look lower-right, **left of Help**.
2. Click **Wiki agent**.
3. The message window stays put. Close it with ✕; the pill returns.

The window knows the **surface** and **route** you are on (for example Heatmap → `options-lab / / app/options-lab/heatmap`). That context becomes the page if you draft from a session.

Unregistered screens are still valid — route-only, less rich.

What you can do in the window

Action	What happens
Hand off	Paste a finished, publishable page and one line of intent. Delivery point — nothing is held in the window. Server infers the rest. Thin or profit-claim copy does not become a page.
Open session	Start a multi-turn session. The agent cites the calling context first.
Send	Add a turn. Proposals stay in the window. They execute nothing until you act.
Draft to board	Writes a git draft (<code>status: draft</code>) and a board card awaiting_approval . Copy: “Draft on the board — you still approve.” Never “Published.”
Seal session	Freezes the transcript. Follow-on work is a new session that can point at the sealed one.
Drain queued revisions	Pulls the next linkage-queue items onto the board. You still approve.

Nothing auto-publishes. You (or another admin) flip `status: published` on the board / in git. Members see it after the wiki host pulls and reindexes.

Drafts vs published (admin read)

Administrators can still open draft slugs. Members and the public cannot. That is the only extra on the read path.

What you will not see

- A second Wiki orb on Wiki routes (the old lower-left IKI-only pill is gone).
 - The Wiki agent cloning Help's emerald look.
 - The agent for a member or signed-out visitor (the node is not in the DOM).
 - A form of schema fields on handoff — artifact + intent only.
 - Factory or Help “pushing” wiki pages. Wiki polls published courses and help guides; new map pages appear only after compose + your approval.
-

What is not a person-facing feature

These shipped in the same program. People do not operate them:

- Help catalog `GET /api/help/guides` (Wiki polls it; Help's own UI is still the emerald concierge).
- Course catalog poll, content hashes, watermarks, 15-minute tick.
- Source-contract ledger rows.

You experience those only as **new or updated wiki pages after you approve a draft**.

Spec / architecture

- Spec of record: Specs/FatTail-Labs-Wiki-Spec-v0_2_1.md (I.1 standing presence, III.3 floating agent, III.2 public read)
- As-built: Architecture/11-wiki-design.md
- Decision: **DL-573** (plane-wide mount, left of Help)
