

Trade Feed Newsfeed for my Trade Newsfeed for Market Structure

AI-Powered, Position-Aware Market Intelligence

Concept

Trade Feed is an AI market-structure coach that continuously interprets the entire FatTail platform in the context of the trader's actual open position.

Once a trader enters a position, they give Trade Feed the strategy, strikes, expiration, entry price and other relevant trade information. Trade Feed then continuously evaluates that position against the complete FatTail data environment—the Heatmap, Volume Profile, gamma/GEX structure, gamma walls, regime classification and the full set of surface metrics including **Gradient, Curvature, Call/Put Asymmetry, Width Efficiency, Surface Velocity, Surface Acceleration, Time Decay, Regime Stability and Anomaly Detection.**

The fundamental problem Trade Feed solves is **interpretation**. FatTail can expose an enormous amount of useful market information, but the more sophisticated the platform becomes, the harder it is for a human trader to simultaneously monitor dozens of changing variables, understand the relationships between them and determine which ones actually matter to the position they currently own.

Trade Feed changes the interaction from:

"Here are all the metrics. Figure out what they mean."

to:

"Here is what matters to your trade right now, why it matters, what has changed, and what you should be watching next."

Position-Aware Intelligence

The trade itself becomes the context for interpreting the platform.

Trade Feed understands where price is relative to the position's strikes, profit area, center/pin, breakevens and risk areas. It then overlays the market's structural levels and continuously asks how they relate to the position.

For example, rather than simply reporting "**Gamma wall at 7780**," Trade Feed could say:

Your 7780 center is currently aligned with a significant gamma concentration and a high-volume node. Multiple independent measures therefore identify the same area as structurally important to your position.

As price moves, Trade Feed follows the interaction. It can identify when price is **approaching a level, testing it, stalling, breaking it, rejecting it or establishing acceptance beyond it**. It can then validate whether the expected confirmation actually occurred.

Event-Driven Coaching

Trade Feed should not constantly generate noise. It should prioritize meaningful changes and manage the trader's attention.

Events could be classified:

INFO → WATCH → IMPORTANT → RED ALERT

The system could identify events such as:

- Price approaching an important structural level
- Entry into an important area of the position
- Price stalling at a gamma wall or Volume Profile boundary
- Gamma-wall creation, disappearance or migration
- Multiple structural metrics converging at the same price
- Breaks, retests, rejection and confirmation of important levels
- Changes in Gradient or Curvature
- Changes in Call/Put Asymmetry
- Surface Velocity or Acceleration increasing
- Regime Stability deteriorating

- Positive gamma transitioning toward negative gamma
- Structural conditions becoming materially different from those present at trade entry
- Anomalous market behavior

The system doesn't need to tell the trader to **buy, sell or exit**. Instead, it explains how the evidence surrounding the trade is changing:

RED ALERT — The market has transitioned from the positive-gamma environment present at entry toward negative gamma. Surface Velocity and Acceleration are also increasing. Price may therefore behave differently around the structural levels that previously contained it. Your position was entered under materially different conditions than currently exist.

The trader retains the decision. Trade Feed improves the information available for making it.

Structural Memory

A major advantage is that Trade Feed remembers the **state of the market when the trade was entered**.

It can therefore answer a much more important question than "What is happening?"

"What has changed since I entered?"

It can track gamma-wall migration, regime transitions, changing Volume Profile, surface behavior and the evolving relationship between those variables and the position.

This creates a continuous structural history of the trade rather than a series of disconnected market snapshots.

Two-Way Conversation

Every Trade Feed post is interactive.

If Trade Feed reports:

SPX is testing 7780. This level combines a gamma wall, Volume Profile boundary and elevated Curvature.

The trader can immediately ask:

Why does that matter to my trade?

Or:

What would confirm a break?

Have we confirmed yet?

Which metrics agree?

Which metrics disagree?

Where is the next important level?

What changed since I entered?

What should I be paying attention to right now?

Most importantly, Trade Feed remembers the conversation. If the trader asks what would constitute confirmation, the AI can monitor those conditions and later proactively report:

The confirmation conditions we discussed earlier have now occurred.

AI Becomes the Interface

This is the larger product opportunity.

FatTail's massive API becomes the underlying **market-intelligence engine**, while the LLM becomes the interface through which the trader understands it.

The trader no longer needs to continuously watch every Heatmap cell, gamma level, Volume Profile feature and surface metric.

The AI watches them simultaneously.

Its job can be summarized in five words:

Observe → Prioritize → Relate → Explain → Confirm

Trade Feed does not replace the trader. It gives the trader an AI market-structure coach capable of monitoring the entire FatTail environment continuously and translating it into one simple question:

What does everything the platform currently knows mean for the trade I own right now?

Trade Feed Mockup

SPX · 0DTE · LIVE

Position: 7750 / 7770 / 7790 CALL Butterfly

Entry: \$4.85 · 11:07 CT

SPX: 7762.40

Regime: POSITIVE GAMMA · STABLE

Structural Alignment: HIGH

11:07 — TRADE FEED

TRADE ENTERED — STRUCTURAL BASELINE

I've mapped your position against current FatTail market structure.

Your **7770 center** is close to both a significant gamma concentration and a developing Volume Profile node.

The current environment is **positive gamma with relatively stable surface conditions**.

Primary level to watch: 7770–7775.

Your position center, gamma structure and Volume Profile currently converge around this area.

Ask: Why does 7770 matter? · What else should I watch?

USER — 11:09

Why does 7770 matter so much?

TRADE FEED — 11:09

Three things currently overlap around 7770:

Your position: 7770 is your center.

Gamma: Significant gamma concentration exists around 7770–7775.

Volume Profile: Meaningful volume has developed near the same area.

Any one provides useful information. Their **confluence** makes the area more structurally significant.

I'll monitor whether that alignment strengthens or weakens.

11:17 — WATCH

APPROACHING YOUR POSITION

SPX 7767.20 ↑

Price is approaching the lower portion of your profit area and is now approximately **3 points from the 7770 structural area.**

Gamma structure remains stable. No significant regime change has occurred.

Current focus: first test of 7770.

Ask: What should I watch here?

USER — 11:18

What should I watch here?

TRADE FEED — 11:18

The important question is whether price **stalls, rejects or establishes acceptance through 7770–7775.**

Because this area overlaps both your position and current gamma/volume structure, price behavior around the level may be more informative than simply touching it.

I'll distinguish between a **test, break and confirmed acceptance.**

11:22 — IMPORTANT

PRICE STALL

SPX 7770.80

Price has remained between **7769–7772 for approximately four minutes.**

Surface Velocity has declined while the dominant gamma concentration remains nearby.

This is consistent with stabilization around the structural area identified earlier.

Your position is currently inside its profit area and close to its center.

Ask: Is structure helping my trade?

USER — 11:23

Is structure helping my trade right now?

TRADE FEED — 11:23

Current structure is **relatively well aligned with your position**.

Price is near your center, gamma concentration remains nearby, Volume Profile supports approximately the same area and the positive-gamma regime remains intact.

The alignment is dynamic. A **gamma-wall migration, regime change or confirmed move through 7775** would change the interpretation.

I'm monitoring all three.

11:31 — IMPORTANT

7775 BROKEN — CONFIRMATION PENDING

SPX 7777.10 ↑

Price has moved above the 7775 structural level.

This is currently a **break, not confirmation**.

Surface Velocity has increased modestly, but the broader regime remains positive gamma.

Ask: What would confirm it?

USER — 11:32

What would confirm it?

TRADE FEED — 11:32

I'm watching for evidence that price can **remain above 7775** rather than temporarily trade through it.

Sustained activity above the level and particularly a successful retest would strengthen the evidence for acceptance.

I'll flag it if those conditions develop.

11:37 — IMPORTANT

7775 CONFIRMED

SPX 7779.10 ↑

The confirmation conditions we discussed have now occurred.

Price remained above 7775, retested approximately **7775.50**, held and subsequently moved higher.

Evidence now favors acceptance above the previous structural level.

Next important area: 7785–7790.

That area is particularly relevant because it overlaps the upper portion of your position.

USER — 11:38

So what matters now?

TRADE FEED — 11:38

The priority has changed.

7775 is now behind price.

The primary question is what happens around **7785–7790**, where gamma structure, Volume Profile and an important area of your position currently converge.

I'll prioritize that interaction over smaller fluctuations between here and there.

11:46 — IMPORTANT

GAMMA WALL SHIFT

SPX 7782.40

The dominant gamma concentration has migrated upward.

At entry, it was concentrated closer to your **7770 center**. It is now developing around **7780–7785**.

One component of the original structural alignment with your center has therefore weakened.

The broader positive-gamma regime remains intact.

Ask: Does this change my trade? · What's changed since entry?

USER — 11:47

Does this increase my risk?

TRADE FEED — 11:47

It changes the **structural relationship** more than it provides a simple higher/lower risk answer.

Your center and dominant gamma concentration were closely aligned at entry. They no longer are.

However, the broader positive-gamma regime remains intact and Volume Profile continues to support the area below price.

The key issue is now whether **gamma continues migrating and whether price establishes acceptance above 7785.**

USER — 11:48

Okay. Tell me if that happens.

TRADE FEED — 11:48

I'll prioritize:

Further gamma-wall migration · Acceptance above 7785 · Material regime change

11:56 — RED ALERT

REGIME CHANGE

SPX 7787.60

One of the conditions we were monitoring has now changed materially.

The market has transitioned away from the earlier **stable positive-gamma environment toward neutral/negative gamma conditions.**

Surface Velocity ↑

Surface Acceleration ↑

Curvature ↑

Regime Stability ↓

Your position was entered under a **materially different structural environment.**

Price is simultaneously testing the **7785–7790 area we identified earlier as important.**

Ask: What does this mean for my trade?

USER — 11:57

What does this mean for my trade?

TRADE FEED — 11:57

The important change isn't simply that SPX moved higher.

The structure surrounding that move has changed.

Earlier, positive gamma and lower Surface Velocity favored stabilization around important levels.

Gamma has now weakened while Velocity and Acceleration have increased.

Because price is simultaneously approaching an important area of your position, **7785–7790 has become the highest-priority structural test.**

USER — 11:58

Are you saying I should get out?

TRADE FEED — 11:58

No. The data does not make that decision for you.

What has changed is the **evidence surrounding the position.**

Several structural conditions present at entry have weakened, while price is approaching another important area.

The immediate structural question is whether **7785–7790 rejects price or becomes accepted under the new regime.**

I'm monitoring that interaction.

12:04 — WATCH

7790 TEST — NO CONFIRMATION

SPX 7789.40

Price is testing the structural area discussed above.

There is currently **insufficient evidence of acceptance above 7790**.

Surface Acceleration has stopped increasing.

Confirmation: NOT YET.

USER — 12:05

What are the metrics telling you?

TRADE FEED — 12:05

The evidence is currently **mixed**.

Gamma: weaker than at entry.

Volume Profile: 7790 remains an important boundary.

Velocity: elevated but no longer increasing.

Acceleration: flattening.

Curvature: remains elevated.

Price: has not established acceptance above 7790.

Taken together, the evidence does **not yet support calling 7790 accepted**.

12:11 — IMPORTANT

REJECTION DEVELOPING

SPX 7784.20 ↓

Price failed to establish acceptance above 7790 and has returned below 7785.

Surface Acceleration has also declined.

The evidence currently favors **rejection of 7785–7790 rather than acceptance above it.**

This is the outcome of the structural test we've been following since 11:38.

USER — 12:12

Give me the big picture versus when I entered.

TRADE FEED — 12:12

AT ENTRY: Positive gamma, stable regime, gamma concentrated near your center, Volume Profile aligned near the center and relatively low Surface Velocity.

SINCE ENTRY: 7775 was tested, broken and confirmed. Gamma migrated higher. The regime weakened. Velocity and Acceleration increased. 7785–7790 subsequently became the dominant structural area and has now been tested and rejected.

CURRENTLY: Price remains within the broader area of your position, but the market structure surrounding that position is materially different from the environment at entry.

What matters next: Whether rejection from 7790 develops toward the earlier 7775 area or price makes another attempt to establish acceptance above 7790.

Ask Trade Feed

Ask anything about your trade or any Feed event...

What matters most right now? · What's changed since entry? · Why is this level important? · Which metrics agree? · Which metrics disagree? · Has this move confirmed? · How does this affect my position?

Trade Feed is therefore not simply an alert system and not simply a chatbot. It is a persistent AI conversation following the life of the trade from entry through management—continuously watching the entire FatTail platform, deciding what matters, explaining why, answering the trader's questions and then following up as the market provides the answer.
